

Project Design Phase
Proposed Solution Template

Date	24 June 2026
Team ID	
Project Name	Software Installation Request Automation
Maximum Marks	2 Marks

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Employees in an organization request software installation through manual emails and phone calls, causing delays, lack of visibility, compliance issues with software licensing, and increased workload for IT teams with no standardized process
2.	Idea / Solution description	A ServiceNow-based Software Installation Request Automation system using a standardized Service Catalog item, Flow Designer workflow for automated approvals, auto-created fulfillment tasks for IT team, Business Rules for exception handling, and email notifications at every stage — all accessible through the Service Portal
3.	Novelty / Uniqueness	Unlike manual email-based processes, this solution provides a fully automated end-to-end request lifecycle within ServiceNow — from submission to approval to task fulfillment — with zero manual coordination, real-time tracking, and built-in license compliance enforcement through Business Rules
4.	Social Impact / Customer Satisfaction	Employees get faster software access with full visibility into request status. IT teams spend less time on manual coordination and more time on critical tasks. Managers get structured, policy-compliant approval requests. Overall IT service satisfaction improves significantly
5.	Business Model (Revenue Model)	This is an internal IT automation project for an organization. Cost savings are achieved by reducing IT support hours spent on manual request handling, minimizing unauthorized software installations, and ensuring license compliance — directly reducing operational costs

6.	Scalability of the Solution	The solution is built on ServiceNow's native Flow Designer and Service Catalog — making it easily scalable to handle multiple software types, departments, and approval groups. Additional catalog items, workflow branches, and notification rules can be added without redesigning the existing system
